Before you begin in Excel you need to read appendix C in your lab manual and come up with your uncertainty. Next you right click on your data series and a menu with format data series should come up. Select that option and you’ll get the second picture. Click on the X/Y Error Bar tabs. Using the fixed value option enter in your uncertainties.
Enter your data in the columns A and B.
Also looking at the prediction equation enter other constants.
If you only enter numbers in the bordered boxes, you shouldn't have any problems.
Don't change the cell labeled delta.
